SUMMARY

Senior full-stack engineer who ships production software with AI coding agents and builds the checks that keep it safe. Since July 2026 about nine in ten of my commits are written with an agent, including 1,276 of 1,357 on the multi-tenant platform I lead, where every push runs tenant-isolation and migration checks. Also build AI products: a shopping assistant covered by 132 behaviour tests that run the real assistant. Lead architecture, planning, cost decisions and code review for a team of 4 to 6 developers. Earlier work shipped to a US state health department, international pharmaceutical brands, and retailers in India, the UAE and the United States.

Selected work: made tenant isolation a build-time guarantee on a 60-model multi-tenant platform built mostly by a coding agent, so a query that could leak one merchant's data into another store fails CI instead of reaching customers, whoever wrote it.

TECHNICAL SKILLS

AI Engineering: Claude Code (project instructions, skills, hooks, permission policy), MCP servers, CI checks for agent-written code; LLM integration (Claude, Gemini, Groq/Llama), tool calling, RAG, embeddings, provider fallback, LLM evals

Languages: TypeScript, JavaScript (ES6+), Go, Dart, Python, PHP, SQL

Frontend: React 19, Next.js (App Router), React Router 7, Angular, Flutter, Tailwind CSS, Redux, Riverpod, TanStack Query

Backend and Data: Node.js, NestJS, Fastify, Express.js, Prisma, PostgreSQL, Supabase, Redis, MongoDB, BullMQ, REST APIs

E-commerce: Shopify Hydrogen and Oxygen, Shopify App Remix, Polaris, App Bridge, Sanity CMS, Razorpay

Infrastructure and Delivery: Docker, GitHub Actions CI/CD, Cloudflare Workers, Vercel, Railway, GCP, Firebase, Nginx, PM2, pnpm and Turborepo monorepos, Jest, Vitest, Cypress, Playwright, Git

Ways of Working: Multi-tenant architecture, technical planning and decision records, cost modelling, security review, code review and mentoring, Agile delivery

PROFESSIONAL EXPERIENCE

SEA Media | Senior Full-Stack Engineer and Project Partner

India (Remote) | 05/2025 - Present

- Enrixa Store:** built a multi-tenant e-commerce platform, now 60 data models and 287 REST endpoints across 52 controllers, where every merchant runs an isolated store on its own subdomain. NestJS, Prisma and PostgreSQL, with separate Next.js apps for the merchant admin and the storefront. Set the tenancy model, the payments layer covering Razorpay and cash on delivery, and the release plan.
- Built it mostly with Claude Code: 1,276 of my 1,357 commits were written with the agent. Made tenant isolation a build requirement: every push runs an isolation check and a migration compatibility check across 91 migrations, so a cross-tenant query fails the build rather than reaching customers, whoever wrote it.
- Designed the safety setup for agent-written code: a hook that stops the agent opening secret files, a review checklist for the tenant leaks static checks miss, and one committed command as the only route to production. Cut the agent's permissions from 662 rules to 62. Agent instructions in 8 production repositories; the reusable checks are open source as **bouncer-gates**, below.
- Enrixa AI:** shipped an AI shopping assistant for Shopify that looks up products and stock while it answers: Fastify streaming replies over SSE, fallback from Claude to Gemini to Claude Sonnet when a provider is busy, BullMQ jobs keeping the catalog in sync, and a shadow-DOM widget. Built 132 behaviour tests that run the real assistant against a demo store, including the refusals a pharmacy must make, and stop a release on any failure. Wrote the product plan and cost model.
- W.I.N.S, Alabama Department of Public Health:** led a two-repository build for an infant safety program. A Next.js 16 and React 19 admin CMS on Supabase, plus a Flutter app for parents tracking their child's health, milestones and vaccinations, both sharing one PostgreSQL database of 15 tables across 11 edge functions. Wrote the schema contract and table ownership rules that let two teams work on the same database without breaking each other's features, backed by about 100 test files across the two repositories. Live on the App Store and Google Play since July 2026 as the state agency's official app for the program.
- Kidulan:** built a Shopify Hydrogen storefront serving more than 10,000 daily users across India, 96 routes on React Router 7, Oxygen and Sanity CMS with four other engineers, and owned the architecture notes and the Oxygen deploy pipeline.
- Price Monitor:** a Shopify app that pulls in competitor catalogs, matches their products against the merchant's own, and adjusts prices by rule. Repricing stays behind a dry run until the merchant approves it.
- Ran deployment and operations across all of it: Docker images, GitHub Actions, Vercel and Shopify Oxygen releases, PM2, and managed PostgreSQL and Redis. More than 250 test files across the client repositories.

NTAM Group (Delta Plus Event Management) | Software Developer

Dubai, UAE | 06/2024 - 04/2025

- Built a gamified training platform for Abbott's medical representatives, used by over 1,000 reps worldwide, with per-region admin panels, a CMS and reporting. Angular, PHP, Node.js, SQL and microservices.
- Delivered L'Oréal's event app for Android and iOS, covering agendas, badge scanning, surveys, live voting and push notifications. Used at more than 5 live events. Flutter, .NET and SQL.
- Built the interactive pieces for Nestlé's Ascenda launch at the Ritz-Carlton, Jeddah: a full-body-tracking growth wall where guests watched themselves grow on a 4 metre screen, then printed or shared the photo, and a Mario-style runner played on an Xbox controller. More than 150 guests used them in one evening. Electron, React, Redux and MediaPipe.
- Built a talking avatar chatbot for Novartis that answered product questions for healthcare professionals, using Next.js, Python, Google TTS and a fine-tuned model.

Indus Real Estate LLC | Full-Stack Developer

Dubai, UAE | 12/2022 - 06/2024

- Built a lease management CRM as a progressive web app covering more than 200 units, tracking lease expiry, payments, cheques, maintenance and reporting. Angular, PHP, Node.js and SQL on Linux.
- Rebuilt the public property site with better filtering and agent contact flows, cutting page load time by 70 percent by fixing first contentful paint. Next.js, Node.js, PHP and SQL.
- Added a CMS with an image pipeline that resizes, crops and converts uploads to WebP through Sharp, along with reporting tools for the content team.

DOSII | Flutter Developer

India | 06/2022 - 12/2022

- Helped build a university admissions platform with predictive analytics that served over 1,000 students in its first quarter, and set up the project's unit and integration tests. Flutter, Python, Firebase, GCP and GetX.

OPEN SOURCE

bouncer-gates - checks every code change for five expensive mistakes before they merge, in CI and inside the editor next to an AI agent. MIT, on npm and listed in the official MCP Registry.

Five checks: leaked secrets, database queries that cross tenants, float arithmetic on currency, migrations that break the running app during a deploy, and documentation links pointing at deleted files. Each gate is a pure function taking files and returning findings, so one implementation runs in CI as a GitHub Action, in Claude Code and Cursor as an MCP server and post-edit hook, in a Cloudflare Worker behind the live playground, as a Node service on Railway, and in the browser as a fallback. Zero runtime dependencies, 159 tests.

Most of the work went into being wrong less often: an early build reported 45 blocking findings on a 1,209-file repository, of which 32 were false positives. Reading all 45 by hand and fixing the causes brought it to 13 findings, all genuine. Every one of the 32 is now a test asserting the gate stays quiet.

github.com/ajeermahmood/bouncer-gates | npmjs.com/package/bouncer-gates

estate - a linter for repositories rather than for the code inside them. MIT, one Go binary.

Checks a directory of repositories in parallel against declarative rules and exits non-zero, so it behaves the same in a terminal and in CI: whether a repository has a remote configured at all, and whether a **.env** would be ignored by the next commit, among others. The first real run found a repository holding six months of work that existed on one disk with nowhere to push. Zero third-party dependencies, 102 tests, cross-compiled for Linux, macOS and Windows on x86-64 and ARM64.

github.com/ajeermahmood/estate

Two small npm utilities: web-element-scraper (extracts text from page elements with Puppeteer and Cheerio) and nodejs-performance-profiler (reports memory, CPU and uptime for Node.js applications).

WRITING

How I build software with AI agents - the workflow, layer by layer, with the commit data. ajeer.website/how-i-work

What my coding agents got wrong, and what caught it - six real mistakes from agent-written code and the check that found each.

ajeer.website/blog

Making a codebase safe for AI coding agents - which rules belong in a linter, a compiler, an instructions file, or a blocking CI gate.
